This reaction was developed by Alexander Williamson in 1850. Typically it involves the reaction of an alkoxide ion with a primary alkyl halide via an S<sub>N</sub>2 reaction. This reaction is important in the history of organic chemistry because it helped prove the structure of ethers. The first step is the protonation of one of the  $\text{C}=\text{C}$  double bonds. In butadiene (1), both double bonds are the same, so it does not matter which one is protonated. The protonation occurs regioselectively to give the more stable carbocation (i.e.,  $\text{B}=\text{C}$  in Figure 1):. The more stable cation is not only secondary, but also allylic, and therefore ...
