Neuralgia is nerve pain that occurs when a nerve is irritated or inflamed and can happen in any part of the body. The severe, stabbing and burning pain spreads along the involved nerve pathways. Types of neuralgia are central neuralgia (originating in the spinal cord or brain), peripheral neuralgia (originating in the peripheral nervous system), postherpetic neuralgia (after an infection with shingles), intercostal neuralgia (nerve pain that occurs around the ribs), trigeminal neuralgia (stabbing face pain), occipital neuralgia (nerve pain in the upper neck, back of the head and behind the eyes), cranial neuralgia (headaches), pudendal neuralgia (pain in the buttocks, scrotum, penis, vulva, perineum and urethra) and glossopharyngeal neuralgia (pain in the neck, tongue and throat). In this naturopathic adviser, I will give you recommendations how to treat and prevent neuralgia with Homeopathy, Schuessler salts (also named cell salts, tissue salts) and herbal tinctures. I will present you the most proven homeopathic remedies and Schuessler salts, including the appropriate potency and dosage. I wish you much success, joy of life and especially your health.

Diabetic Neuropathy Macmillan

The authors are in a life and death struggle against a terrible disease, Amyotrophic Lateral Sclerosis, which is referred to as ALS or Lou Gehrig's disease. If you or a loved one have been diagnosed with ALS, then you need to read this book. The Deanna Protocol(r) program was discovered by Dr. Tedone, Deanna's father, only after failing, again and again, with everything that he tried. The massage, non-exhausting exercise and core supplements are inexpensive and available without prescription from many suppliers. The program works for many ALS patients. It is not a cure; however, it provides a better quality of life and has been shown in ALS mice to extend life and improve motor skills. The rate of progression of ALS symptoms reported in ALSFRS scores, is markedly reduced in those adhering to the Deanna Protocol(r) program. There are few side effects reported, and those are manageable for most, if the program is phased in, gradually, over time. The main stream pharmaceutical giants and neurologists have taken little notice or remain skeptical about any program targeting metabolic support of motor neurons. However, we are winning over some of the skeptics, when they see, first-hand, how much their own patients are benefiting from the Deanna Protocol(r) program. An investigation at the University of South Florida has shown that SOD1-G93A mice live longer and better when on the core supplements of the Deanna Protocol(r) program. To our knowledge, the Deanna Protocol(r) program is the only program tested on these particular mice that has ever shown a statistically significant extension of life compared to controls. We were not surprised, because the program already showed effectiveness in Deanna and many other patients with ALS (PALS). More surprising to us is the anecdotal evidence that the core supplements of the Deanna Protocol(r) program helps patients with other neurological conditions, such as Alzheimer's. An investigation of these other conditions is beyond our foundation's capability. We don't have sufficient assets to meet the needs for research into ALS. Much of the costs of the progress made to date have been borne by the Tedone's and a short list of donors to Winning the Fight, Inc., a foundation established by the Tedone family. If the foundation had more money, the research could progress much faster in ALS and other neurological conditions could be included, which have shown benefits to patients from taking the core supplements of the Deanna Protocol(r) program. The authors are convinced that there is a common denominator among many neurological conditions that could, potentially, benefit from the Deanna Protocol(r) program or some program based on the core supplements of the Deanna Protocol(r) program. Possibly, Alzheimer's, Parkinson's, stroke, traumatic brain injury and other neurological conditions could all share a

common pathway for neuron cell death, a lack of energy in the cells. The authors believe that one of the supplements taken as part of the Deanna Protocol(r) program provides energy to distressed cells in which normal cellular metabolism has been disrupted. From research completed after the manuscript for this book was written, Dr. Tedone believes that many of these neurological conditions could benefit from a program tailored toward keeping more of the neurons from dying. This Preface and an Afterword have been added to the soft cover edition of this book. If you are interested in our efforts to discover a metabolic program for benefiting the health of patients with neurological conditions resulting in neuron cell death, then turn to the Afterword for a discussion on our evolving hypothesis. Also, the Deanna Protocol(r) program continues to evolve over time as more research is conducted and more PALS report their results to us. The brain is the most complex organ in our body. Indeed, it is perhaps the most complex structure we have ever encountered in nature. Both structurally and functionally, there are many peculiarities that differentiate the brain from all other organs. The brain is our connection to the world around us and by governing nervous system and higher function, any disturbance induces severe neurological and psychiatric disorders that can have a devastating effect on quality of life. Our understanding of the physiology and biochemistry of the brain has improved dramatically in the last two decades. In particular, the critical role of cations, including magnesium, has become evident, even if incompletely understood at a mechanistic level. The exact role and regulation of magnesium, in particular, remains elusive, largely because intracellular levels are so difficult to routinely quantify. Nonetheless, the importance of magnesium to normal central nervous system activity is self-evident given the complicated homeostatic mechanisms that maintain the concentration of this cation within strict limits essential for normal physiology and metabolism. There is also considerable accumulating evidence to suggest alterations to some brain functions in both normal and pathological conditions may be linked to alterations in local magnesium concentration. This book, containing chapters written by some of the foremost experts in the field of magnesium research, brings together the latest in experimental and clinical magnesium research as it relates to the central nervous system. It offers a complete and updated view of magnesium's involvement in central nervous system function and in so doing, brings together two main pillars of contemporary neuroscience research, namely providing an explanation for the molecular mechanisms involved in brain function, and emphasizing the connections between the molecular changes and behavior. It is the untiring efforts of those magnesium researchers who have dedicated their lives to unraveling the mysteries of magnesium's role in biological systems that has inspired the collation of this volume of work.
